

CCCIT: Principal Payment Rate

Notes:

- The principal payment rate percentage is calculated by taking principal received over the due period and dividing it by the principal receivables balance as of the beginning of the due period. If there is a lump sum addition or lump sum removal during the due period, then the denominator is the weighted average principal receivables balance over the due period.

- This series is shown as a three-month moving average.

- Data is current through the August 2026 due period.
